$$\text{Find } \quad u \in \mathcal{K}_g \quad a(u, v - u) \geq \ell(v - u) \quad \forall v \in \mathcal{K}_g$$

## Application to several problems in contact mechanics

**Obstacle problem:** Find  $\mathbf{u} \in \mathcal{K}_g := \{v \in H^1(\Omega) \text{ s.t. } v = g \text{ on } \partial\Omega, \text{ and } v \geq \psi \text{ in } \Omega\}$  such that

$$(\nabla u, \nabla(v - u))_\Omega \geq (f, v - u)_\Omega \quad \forall v \in \mathcal{K}_c$$

- $u$ : displacement of an elastic membrane
  - $\psi \in H^1(\Omega)$ : position of the lower obstacle
  - $f \in L^2(\Omega)$ : force acting on the membrane
  - $g \in H^{\frac{1}{2}}(\partial\Omega)$ : Dirichlet boundary datum for  $u$

**Signorini problem:**  $\partial\Omega = \Gamma_D \cup \Gamma_N \cup \Gamma_C$

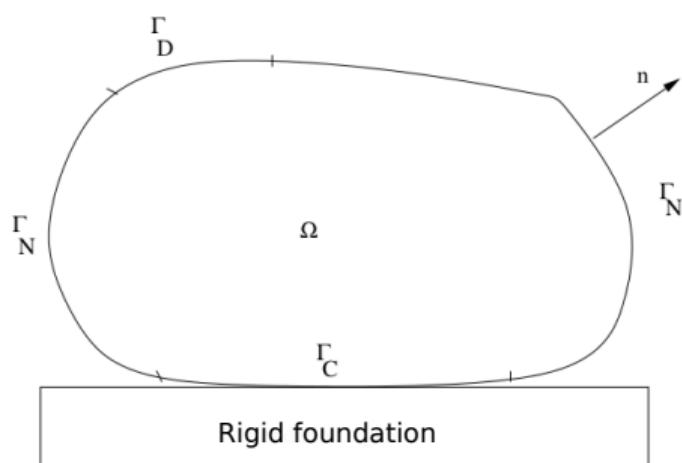

$\Gamma_D$ : Dirichlet boundary conditions,  $\Gamma_N$ : Neumann boundary conditions

$\Gamma_C$ : Unilateral contact boundary conditions

Find  $\mathbf{u} \in \mathcal{K}_g := \{\mathbf{v} \in [H^1(\Omega)]^2 \text{ s.t. } \mathbf{v} = \mathbf{g} \text{ on } \Gamma_D, \text{ and } \mathbf{v} \cdot \mathbf{n} \leq 0 \text{ on } \Gamma_C\}$  such that

$$(\sigma(\textcolor{red}{u}), \epsilon(\textcolor{violet}{v} - \textcolor{red}{u}))_\Omega \geq (\textcolor{blue}{f}, \textcolor{violet}{v} - \textcolor{red}{u})_\Omega + (\textcolor{blue}{g}_N, \textcolor{violet}{v} - \textcolor{red}{u})_{\Gamma_N} \quad \forall \textcolor{violet}{v} \in \mathcal{K}_g$$

- $\mathbf{g} \in \left[H^{\frac{1}{2}}(\Gamma_D)\right]^2$  : Dirichlet boundary datum for  $\mathbf{u}$
  - $\mathbf{g}_N \in [L^2(\Gamma_N)]^2$  : Neumann boundary data
  - $f \in [L^2(\Omega)]^2$  : force acting on the elastic solid
  - $\sigma(\mathbf{u})$  : stress tensor
  - $\epsilon$  : strain tensor
  - $\sigma(\mathbf{u}) = \mathbb{A}\epsilon(\mathbf{u})$  where  $\mathbb{A}$  is the fourth-order elasticity tensor

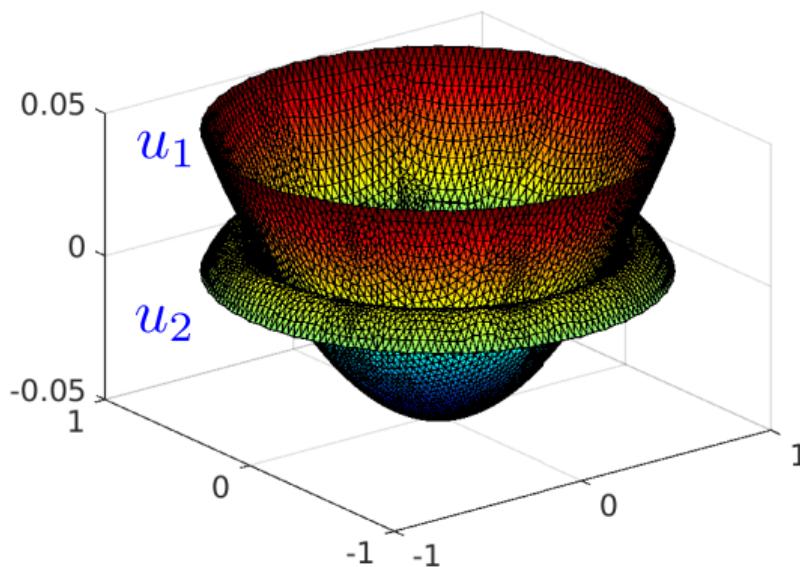

### Contact between two membranes:

Find  $\mathbf{u} := (\mathbf{u}_1, \mathbf{u}_2) \in \mathcal{K}_g := \{\mathbf{v} = (v_1, v_2) \in H_{g_1}^1(\Omega) \times H_{g_2}^1(\Omega) \text{ s.t. } v_1 - v_2 \geq 0 \text{ a.e. in } \Omega\}$  such that

$$\sum_{\alpha=1}^2 \mu_\alpha (\nabla \textcolor{red}{u}_\alpha, \nabla (v_\alpha - \textcolor{red}{u}_\alpha))_\Omega \geq \sum_{\alpha=1}^2 (f_\alpha, v_\alpha - \textcolor{red}{u}_\alpha)_\Omega \quad \forall \boldsymbol{v} \in \mathcal{K}_g$$

- $\mu_1, \mu_2 > 0$ : tensions of the membranes
  - $g_1 \geq g_2$  : boundary data
  - $f_1 \in L^2(\Omega), f_2 \in L^2(\Omega)$ : external sources

In HHO we employ two operators:

- **Gradient reconstruction operator in every cell:**  $\mathbf{G}_K : X_{h,K}^p \rightarrow \mathbb{P}_p(K; \mathbb{R}^2)$  such that

$$(\mathbf{G}_K(\hat{v}_K), \mathbf{q})_K := (\nabla \hat{v}_K, \mathbf{q})_K + (v_{\partial K} - \hat{v}_K, \mathbf{q} \cdot \mathbf{n}_K)_{\partial K}, \quad \forall \hat{v}_K \in X_{h,K}^p, \quad \forall \mathbf{q} \in \mathbb{P}_p(K; \mathbb{R}^2),$$

It approximates the gradient at the continuous level

- **Stabilization operator**

$$s_h(\hat{u}_h, \hat{v}_h) := \sum_{K \in \mathcal{T}_h} h_K^{-1} \left( \Pi_{\partial K}^{p-1}(u_{\partial K} - \hat{u}_K), v_{\partial K} - \hat{v}_K \right)_{\partial K}$$

**Bilinear form:**  $\forall \hat{v}_h \in X_h^p, \forall \hat{w}_h \in X_h^p$

$$\mathcal{A}_h(\hat{v}_h, \hat{w}_h) := \sum_{K \in \mathcal{T}_h} (\mathbf{G}_K(\hat{v}_K), \mathbf{G}_K(\hat{w}_K))_K + s_h(\hat{v}_h, \hat{w}_h)$$

**Discrete variational inequality:** find  $\mathbf{u}_h = (u_{1h}, u_{2h}) \in \mathcal{K}_{gh}^p$  such that

$$\sum_{\alpha=1}^2 \mu_\alpha \mathcal{A}_h(u_{\alpha h}, v_{\alpha h} - u_{\alpha h}) \geq \sum_{\alpha=1}^2 \sum_{K \in \mathcal{T}_h} (f_\alpha|_K, v_{\alpha h}|_K - u_{\alpha h}|_K)_K \quad \forall \mathbf{v}_h = (v_{1h}, v_{2h}) \in \mathcal{K}_{gh}^p \quad (\text{DR})$$

# HHO performance

- In dG-SIPG,  $\mathcal{A}_h$  is coercive provided that the coefficient  $\gamma > 0$  (stabilization term) is large enough. The matrix associated to  $\mathcal{A}_h$  is symmetric.
- In dG-NIPG, the stability is unconditional but the matrix associated to  $\mathcal{A}_h$  is not symmetric.
- In HHO,  $\mathcal{A}_h$  is always coercive and the associated matrix is symmetric. The polynomials attached to the cells can be eliminated through a static condensation procedure.  
**Static condensation:** It occurs within the assembly part. A linear system expressed on the faces is derived. To recover the cell unknowns we solve local problems.

The blue DOFs are eliminated!

# Summary

Find  $u_1, u_2, \lambda$  such that

$$\begin{cases} -\mu_1 \Delta u_1 - \lambda = f_1 & \text{in } \Omega, \\ -\mu_2 \Delta u_2 + \lambda = f_2 & \text{in } \Omega, \\ u_1 - u_2 \geq 0, \quad \lambda \geq 0, \quad (u_1 - u_2)\lambda = 0 & \text{in } \Omega, \\ u_1 = g_1, \quad u_2 = g_2 & \text{on } \partial\Omega. \end{cases}$$

We proposed several numerical schemes : FEM, dG, HHO leading to a discrete system of PDEs with complementarity constraints:

$$\mathbb{E}\mathbf{X}_h = \mathbf{F},$$

$$\mathbf{X}_{1h} - \mathbf{X}_{2h} \geq 0, \quad \mathbf{X}_{3h} \geq 0, \quad (\mathbf{X}_{1h} - \mathbf{X}_{2h}) \cdot \mathbf{X}_{3h} = 0.$$

# Newton-min convergence

## Theorem

*The Newton-min Algorithm is well defined. Moreover, if the first guess  $\mathbf{X}_h^0$  is close enough to the solution  $\mathbf{X}_h^*$  to the nonlinear system, then the sequence  $(\mathbf{X}_h^k)_{k \geq 1}$  converges to  $\mathbf{X}_h^*$  with a finite number of semismooth iterations and the local convergence is quadratic.*

*In other words,*

$$\left\| \mathbf{X}_h^k - \mathbf{X}_h^* \right\|_2 \leq K \left\| \mathbf{X}_h^{k-1} - \mathbf{X}_h^* \right\|_2^2,$$

## Conclusion

# Conclusion and perspectives

## Conclusion

- We proposed several numerical schemes for variational inequalities.
- We devised a posteriori error estimates with  $\mathbb{P}_p$  finite elements distinguishing the error components.
- Adaptive stopping criteria  $\Rightarrow$  reduction of the number of iterations.
- Our a posteriori analysis works for unsteady problems (Two-phase flow with phase transition).

# Conclusion and perspectives

## Conclusion

- We proposed several numerical schemes for variational inequalities.
- We devised a posteriori error estimates with  $\mathbb{P}_p$  finite elements distinguishing the error components.
- Adaptive stopping criteria  $\Rightarrow$  reduction of the number of iterations.
- Our a posteriori analysis works for unsteady problems (Two-phase flow with phase transition).

## Perspectives

- Extension of the stationary contact problem to a hyperbolic contact problem between two vibrating membranes.
- Devise a posteriori error estimators for HHO
- Construct a posteriori error estimates for a multiphase multi compositional flow with several phase transitions.
